

Last Name: \_\_\_\_\_

First Name: \_\_\_\_\_

**Short Python function/method descriptions:**

```
--builtins--:
int(x: object) -> int
    Convert x to an integer, if possible. A floating point argument will be truncated towards zero.
len(x: object) -> int
    Return the length of list, tuple, or string x.
print(values: object) -> None
    Prints the values.
range([start: int], stop: int, [step: int]) -> list-like-object of int
    Return the integers starting with start and ending with stop - 1 with step
    specifying the amount to increment (or decrement). If start is not specified,
    the sequence starts at 0. If step is not specified, the values are incremented by 1.
str(x: object) -> str
    Return an object converted to its string representation, if possible.
str:
    x in s -> bool
        Produce True if and only if string x is in string s.
    S.count(sub: str[, start: int[, end: int]]) -> int
        Return the number of non-overlapping occurrences of substring sub in string S[start:end].
        Optional arguments start and end are interpreted as in slice notation.
    S.find(sub: str[, i: int]) -> int
        Return the lowest index in S (starting at S[i], if i is given) where the
        string sub is found or -1 if sub does not occur in S.
    S.isalpha() -> bool
        Return True if and only if all characters in S are alphabetic
        and there is at least one character in S.
    S.isalnum() -> bool
        Return True if and only if all characters in S are alphanumeric
        and there is at least one character in S.
    S.isdigit() -> bool
        Return True if and only if all characters in S are digits
        and there is at least one character in S.
    S.islower() -> bool
        Return True if and only if all cased characters in S are lowercase
        and there is at least one cased character in S.
    S.isupper() -> bool
        Return True if and only if all cased characters in S are uppercase
        and there is at least one cased character in S.
    S.lower() -> str
        Return a copy of the string S converted to lowercase.
    S.replace(old: str, new: str) -> str
        Return a copy of string S with all occurrences of the string old replaced with the string new.
    S.upper() -> str
        Return a copy of the string S converted to uppercase.
list:
    x in L -> bool
        Produce True if and only if object x is in list L
    L.append(item: object) -> None
        Append item to end of list L.
    L.extend(items: iterable) -> None
        Extend list L by appending elements from items. Strings and lists are
        iterables whose elements are characters and list items respectively.
```
